

Activity-5

Topics Covered: Applets & Basics, Networking Programming and RMI, Servlets and Web applications, EJB Basics

1. Explain the complete life cycle of an Applet with a suitable diagram and example. Also explain how it interacts with HTML.
2. Describe socket programming in Java with client-server architecture. Explain how communication is established.
3. Explain Remote Method Invocation (RMI) in detail. Describe architecture, components, and working process.
4. Explain the architecture of web applications using Servlets. Discuss the role of the Servlet container and request-response model.
5. Differentiate between Applets and Servlets in terms of execution, security, and performance.
6. Describe different types of Session Beans (Stateful, Stateless). Explain their lifecycle and use cases.
7. Discuss EJB security mechanisms. Explain how authentication and authorization are handled.
8. Evaluate the role of Servlets in modern web applications compared to newer technologies.
9. Analyze how EJB simplifies enterprise application development.
10. Discuss the advantages and challenges of using RMI in distributed systems.
11. What are the limitations of socket programming compared to RMI?
12. A web application needs to process user requests dynamically.
Explain why Servlets are preferred over Applets.
13. A system requires communication between two remote machines.
Explain how socket programming can be used.
14. Describe the HTML tags and attributes used to embed an applet. Explain parameters like code, width, height, and param with suitable examples.
